00 · SUMMARY

Tock at a glance

Tock is a time clock that lives on the wall as a QR code and in every employee's pocket as their phone. Employees scan the code, Tock checks they're really on-site, and one tap clocks them in or out. Managers see who's in the building right now, and payroll gets hours they can trust.

For owners

Set up a location and print its poster in about 5 minutes. No keycards, no hardware, no installation project.

For employees

Scan with the phone camera and tap once. No app to install, no badge to lose. They can see their own hours.

For managers and payroll

A live headcount, alerts for late arrivals and missed clock-outs, and timesheets ready to export.

Where we start

Small businesses with **10–200 hourly employees on 1–5 sites** (cafés and restaurants, retail, small warehouses, clinics, gyms) that use keycards, paper or a wall clock today.

What makes it different

- **Proven on-site.** A location check plus a QR code that changes over time, so a photo of the poster doesn't work from home.
- **Three seconds, no install.** It runs in the phone's browser.
- **A personality.** Bold, quick and a little cheeky, so employees actually like using it.
- **Fair to both sides.** Employees see their own hours, and every timesheet edit is recorded.

Status today

A clickable UI prototype with a sign-in screen (still in its original visitor style), an admin dashboard with sample data, and a QR poster generator. Saving data, logins and on-site checks come next (see section 09).

Why Tock exists

Mission

Give every small business a time clock its team doesn't hate, and hours its owner can trust.

Vision

Clocking in should take three seconds and feel good. Tock replaces keycard swipes and beige wall-mounted time clocks with a QR code on the wall and the phone already in every employee's pocket. Managers can see who's in the building right now and trust that the hours they pay for were actually worked.

Values

Each value is also a product rule.

Proven, not assumed

Every clock-in is checked on-site by the server. Anything that fails a check is blocked or flagged, never silently accepted.

Location at the moment, never all day

Tock checks where an employee is only when they clock in or out. It never tracks them during a shift or after they leave.

Three seconds or it’s broken

The path from scan to "You're in" has no extra screens, forms or loading spinners. If it takes longer, that's a bug.

Fair to both sides

Employees can see their own hours. Timesheet edits never overwrite the original. Each edit records who made it and why.

The problem and the product

The problem

- **Keycards and hardware clocks are a hassle.** They cost money, get lost, break, and need someone to manage them.
- **Hours are hard to trust.** "Buddy punching" (one employee clocking in for another) and padded shifts are common. In one vendor-commissioned survey, 16% of workers admitted to buddy punching, most often adding about 15 minutes.[5]
- **"Who's in the building?" is hard to answer.** That matters for safety (fire roll calls) and for day-to-day operations.

The product

Surface	Who	What it does
Wall QR poster	Admin prints, everyone scans	One per location or entrance. Opens Tock's clock-in screen
Clock-in screen (mobile web)	Employees	Recognizes the employee, checks they're on-site, then one big button: **Clock in** or **Clock out**
Admin dashboard	Managers and owners	Live headcount, activity feed, timesheets, exceptions (late, missed clock-out), CSV and payroll export
Location manager	Admins	Create locations, set geofences, print QR posters

Core capabilities (final version)

1. **Saved clock-ins.** Every clock event is stored and can be audited.
2. **Admin login** and role-based access (owner, manager, employee).
3. **Employee identity:** employees sign in once on their phone and stay signed in. They never retype their name.
4. **Proof of presence:** a geofence check plus a rotating QR code, so a photo of the poster doesn't work from home.
5. **Proximity prompts:** "You've arrived at Main office, clock in?" when the phone enters a location (planned for a later phase).
6. **Timesheets and exports:** hours per employee per pay period, with exports to payroll.

01 · HOW IT WORKS

End to end

The owner’s setup (once)

Sign up

Create the organization and set the time zone.

Add a location

Name, address and a geofence radius.

Print the poster

Tape it by the staff door.

Invite the team

Employees get a one-time sign-in link.

The employee’s shift (every day)

Arrive

Scan the wall QR, or tap a proximity prompt (later phase).

Checked

Tock confirms who they are and that they're on-site.

Clock in

One tap. "You're in at 8:57."

Clock out

Scan and tap again at the end of the shift.

The manager’s routine (ongoing)

Watch

Live headcount and activity.

Review

Flagged clock-ins and missed clock-outs.

Approve

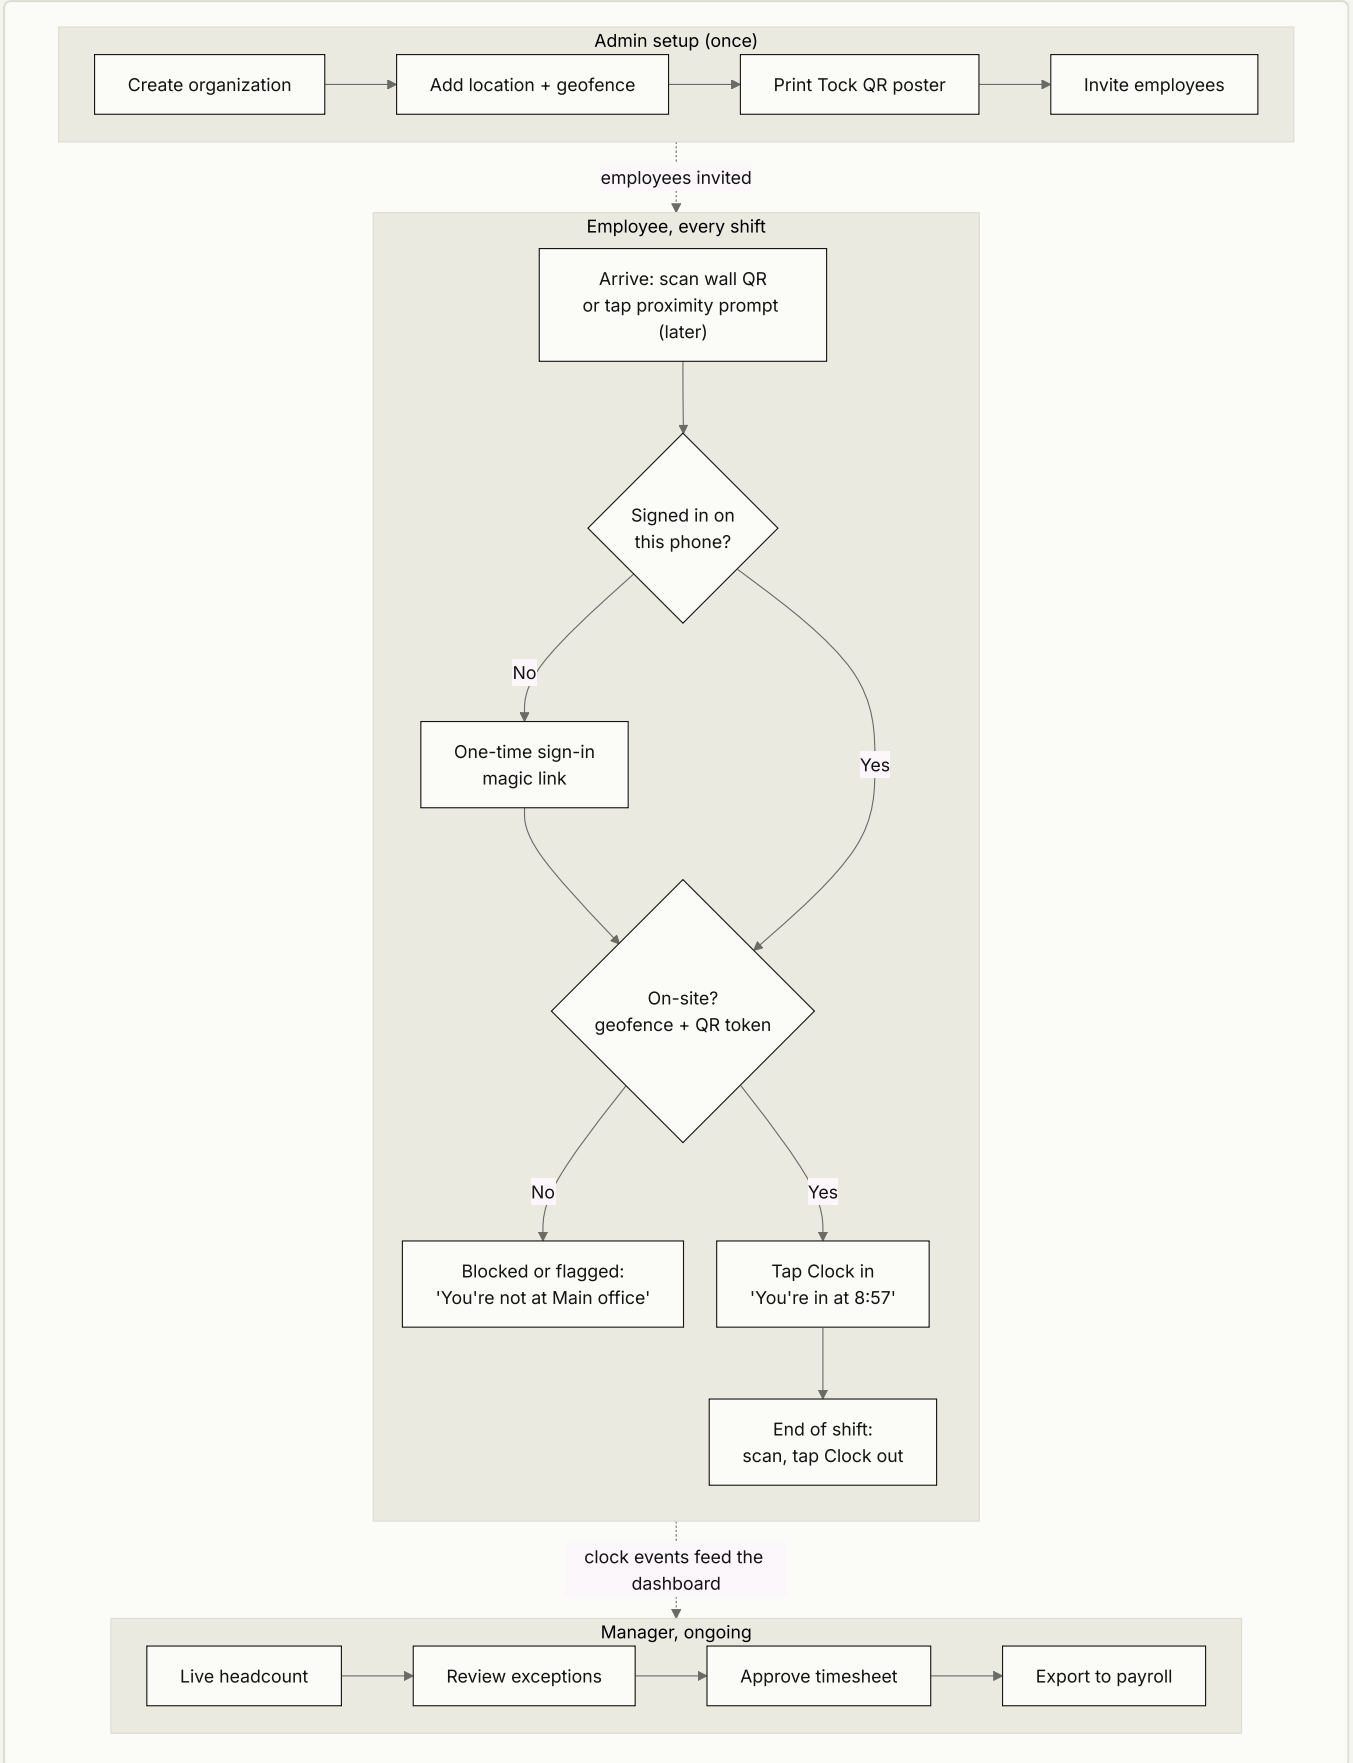

The week's timesheets.

Export

Hours to payroll.

01 · HOW IT WORKS

User journey and workflow

01 · A WORKED EXAMPLE

Daybreak Coffee

Daybreak Coffee is a made-up business. It will also be the demo account and the script for demo videos.

Daybreak Coffee runs three cafés with 24 hourly staff. Until now it used key fobs for the back door and a paper sign-in sheet for hours.

Setup · Monday, 8 minutes

Maya, the owner, signs up and adds the Main Street café with a 60 m geofence. She prints its Tock poster and tapes it by the staff door. Then she invites her staff by email.

First shift · Tuesday, 6:52 am

Sam, a barista, scans the poster. Because it's the first time, Tock sends a one-time sign-in link, and Sam stays signed in on that phone from then on. The location check passes (18 m from the café). Sam taps **Clock in** and sees "You're in at 6:52. Have a good one." Maya's dashboard updates to "7 in the building."

A blocked punch · Tuesday, 7:10 am

Leo is running late and scans a photo of the poster from the bus, 3 km away. Tock shows "Looks like you're not at Main Street. Get closer and try again." The attempt appears on Maya's exceptions list.

A missed clock-out · Tuesday, 3:00 pm

Sam forgets to clock out. At 3:30 Tock sends a reminder and flags the shift. The next morning Maya fixes the clock-out time and adds a reason. The original record and the edit are both kept.

Payday · Friday. Maya reviews the week's timesheets, approves them and exports a CSV for payroll. The whole process takes minutes, not an afternoon of reading paper sheets.

02 · MARKET OPPORTUNITY

A proven, growing category

$3.7–4.0B

Global time and attendance software market, 2025 estimates.[1] [2] [3]

7–10%

Estimated annual growth, reaching roughly $6B+ by 2030–2032.

~38%

Share held by North America, the largest region.[4]

Estimates vary between research firms, so we treat these figures as a rough guide.

Tailwinds

- Businesses are switching from hardware to phone-based time clocks.
- Small businesses are adopting SaaS for HR and payroll (Gusto, QuickBooks, etc.).
- Wage-and-hour compliance is drawing more attention.
- Nearly every hourly worker now has a smartphone.

The pain is real but poorly measured

The often-cited "$373M a year lost to buddy punching" comes from a 2017 vendor survey.[5] We use it as a sign the problem is real, not as a headline number.

Our bet: the category is proven and growing, and the tools that lead it are full-featured but generic. There's room for a focused, fast, likeable product aimed at small teams.

Hours you can trust

Tock turns any wall into a time clock. Print a QR code, and your team clocks in from their phones in three seconds, verified on-site, with no keycards or hardware. You see who's in right now, and payroll gets **hours you can trust.**

Value matrix

Stakeholder	Pain today	What Tock gives them	Proof point
Owner / buyer	Paying for unworked time; keycard and hardware costs	Verified on-site clock-ins; no hardware to buy	Hours paid vs. hours verified
Ops / shift manager	"Who's here?"; chasing missed clock-outs	Live headcount, exception alerts	Minutes per week spent fixing timesheets
Payroll / bookkeeper	Messy paper or spreadsheet timesheets	Clean, approved exports	Time to run payroll
Employee	Lost badges, queues at the clock, disputed hours	3-second clock-in on their own phone; their hours are visible	Clock-in time; disputes per month
Safety / facilities	No reliable roll call in an emergency	Real-time list of who's on-site	Roll-call time in drills

Pricing hypothesis (to validate)

Competitors land around **$3–6 per user per month**, often with a free tier.[6] [7]

Free

Up to 5 employees, 1 location. Also helps spread the product through QR posters.

Team · ~$3

Per active employee per month. Unlimited locations, geofencing, exports.

Pro · ~$5

Per active employee per month. Payroll integrations, proximity prompts, scheduling, audit log.

04 · COMPETITIVE ADVANTAGES

Where Tock fits

> **To be honest up front:** QR clock-in and geofencing are not unique. Jibble, Connecteam and Homebase all offer some version of them.[6] [7] [8] Tock wins on **focus, speed and feel**, not on a feature checklist.

The alternatives a business has today

Alternative	What it does well	Where it falls short for a small team
Keycards and fobs	Familiar; also open doors	Cards cost money and get lost. Lending a card is buddy punching. They don't give a clear view of hours
Wall time clocks (punch, PIN or biometric)	On-site by design	Hardware to buy and maintain, queues at shift change. Fingerprint and face scanning bring extra privacy rules in some places
Paper sheets and spreadsheets	Free and flexible	Easy to fake, slow to total for payroll, no live headcount
A shared tablet time clock	Cheap, on-site	One device for everyone means queues. PINs get shared
All-in-one workforce apps (Jibble, Connecteam, Homebase and similar)	Full-featured; QR, geofencing and free tiers	Broad suites with more to set up and learn. They often push a native app install, and they look generic

Tock's edge

Advantage	Why it matters	Defensibility
No hardware, no app install	Mobile web: scan and go. Lowest friction for new hires and seasonal staff	Medium. Others could copy it, but most push their native apps
Two-factor presence check (geofence + rotating QR)	Stops "photo of the poster" and remote buddy punching	Medium. It's in how we build the product, not a patent
Distinctive brand and personality	Employees actually like using it; the posters on the wall advertise Tock	High. Brand is hard to copy
Setup in minutes	Owner creates location → prints poster → done	Medium
Does one thing well	No sprawling HR suite; easier to sell and support	Strategic choice
Live headcount as a safety feature	Opens up sales to facilities and safety buyers, not just payroll	Medium

Main competitors to watch: Jibble, Connecteam, Homebase, QuickBooks Time, Deputy, When I Work, plus legacy hardware clocks and keycard systems.

Who Tock is for

Primary ICP	
Business size	10–200 hourly employees, 1–5 physical sites
Industries	Restaurants and cafés, retail, light manufacturing and warehouses, clinics and dental offices, gyms, cleaning and facilities firms, coworking spaces
Current setup	Keycards or fobs, a paper sign-in book, a wall clock, or a shared tablet
Trigger events	Opening a new location, a hardware clock dying, a payroll dispute, a failed fire drill, an audit
Buyer	Owner/operator or operations manager (and often also the admin)
Users	Hourly staff, often young and mobile-first. Tock's bold look is aimed at them

Not a fit (for now)

- Fully remote or desk-based teams (they need activity trackers, not presence checks)
- Enterprises needing union rules, complex shift differentials, or biometric hardware
- Field crews with no fixed site (possible later with per-job geofences)

Start local, then spread

1. **Founder-led pilots (months 0–3):** 5–10 local businesses from our own networks. Free in exchange for feedback and a testimonial.
2. **Free tier funnel:** self-serve signup, first poster printed in under 5 minutes.
3. **Content and SEO:** "replace keycards," "stop buddy punching," "free QR time clock," fire roll-call templates.
4. **Marketplaces and listings:** Capterra, G2, GetApp; the Gusto and QuickBooks app stores once integrations exist.
5. **Vertical playbooks:** pick one beachhead industry (e.g., cafés/restaurants or small warehouses), build case studies there, then expand.
6. **Partners (later):** bookkeepers and payroll providers who recommend Tock to their clients.

Built-in growth

The poster is the ad

Every QR poster says "Clock in with Tock" with a small "get Tock for your team" link. Every customer's staff door advertises Tock to everyone who walks past it.

Employees carry it to their next job

Hourly workers change jobs often. Someone who liked clocking in with Tock is likely to suggest it at their next workplace, sometimes as the manager.

Bookkeepers multiply

One bookkeeper or payroll firm serves dozens of small businesses. If Tock's exports save them time, they'll recommend it to all of their clients.

Early metrics: time to first clock-in after signup, weekly active locations, clock-ins per employee per week, free → paid conversion, retention at 90 days.

Bold, quick, a little cheeky

Name

Tock, the second half of *tick-tock*. Short, easy to say, and it works as a verb ("did you tock in?"). Trademark and domain availability not yet checked.

Personality

Bold, quick, confident, a little cheeky. Streetwear energy, not office software. Tock respects your time: nothing on screen that doesn't need to be there.

Color: ”Electric”

ink	volt	bone	pop	graphite	smoke
#141414	#C6F432	#F5F5F0	#FF5C8A	#2A2A2A	#8A8A85

Token	Use
ink	Primary background (dark-first UI), primary text on light surfaces
volt	Brand accent, primary action (Clock in), highlights. Text on volt is always ink
bone	Text on ink; light-mode background; print posters
pop	Secondary accent: Clock out, alerts, exceptions
graphite	Raised surfaces, chips, cards on ink
smoke	Secondary text, captions

Rules

- Dark (ink) is the default for the employee clock-in screen; the admin dashboard may offer light mode using bone.
- Volt is precious: **one** volt element per screen, the main action.
- Never put volt text on bone. The contrast is too low. Use ink on volt, or volt on ink.
- Status: clocked in = volt, clocked out = bone/smoke, exception = pop.

Type, voice and feel

Typography (proposal)

Space Grotesk

Display and numbers: the big clock "8:57", headings. This document uses it for its headlines.

Inter

UI and body text, for readability (or the existing Geist). Big, confident numerals: the time is the star of the clock-in screen.

Voice and copy

Instead of	Tock says
"Submit"	"Clock in" / "Clock out"
"Sign-in successful"	"You're in at 8:57. Have a good one."
"Headcount: 12"	"12 in the building"
"Error: location invalid"	"Looks like you're not at Main office. Get closer and try again."
"Good morning" (always)	Changes with the time of day: "Morning, Jordan" / "Late one tonight?"

Motion and feel

- Clock-in confirmation: quick scale + volt pulse, plus a vibration on supported phones.
- Big tap targets (the round clock button is at least 96px), fast transitions (under 200ms), no loading screens on the happy path.

QR poster

Ink background, a large QR code on a bone tile, location name, the wordmark "tock" in volt, and "Scan to clock in." Must also print well in black and white.

A small, modern stack

Layer	Choice	Notes
Frontend	**Next.js 16** (App Router) + React 19 + Tailwind 4	Already in the repo
Hosting	**Vercel**	Preview deployment for every PR
Database	**Supabase Postgres**	Row-level security (RLS) gives each org access only to its own data
Auth	**Supabase Auth**	Magic link / OTP for employees; email + password or SSO for admins
Realtime	**Supabase Realtime**	Live headcount and activity feed on the dashboard
QR rendering	`qrcode.react`	Already in the repo
Proximity (later)	PWA with push notifications, or a thin native wrapper (Expo/Capacitor)	Browsers can't run background geofences, so arrival prompts need a native wrapper or app

Data model (initial)

```
organizations (id, name, timezone, plan, created_at)
locations     (id, org_id, name, slug, lat, lng, radius_m, qr_secret, active)
members       (id, org_id, user_id, display_name, role: owner|manager|employee, active)
clock_events  (id, org_id, member_id, location_id, type: in|out, at,
               lat, lng, accuracy_m, distance_m, qr_token_ok, flagged, flag_reason,
               source: qr|prompt|manual, edited_by, edit_reason)
shifts        (id, org_id, member_id, location_id, starts_at, ends_at)   -- later
timesheets    (view: pairs in/out events per member per pay period)
```

Proof of presence

1. Rotating QR token

The QR code includes a signed, time-limited token: a static poster plus a server-checked code, or a rotating code on a cheap tablet display for high-security sites.

2. Geofence

At clock-in, the browser shares the phone's location. The server checks the distance from the location's center against `radius_m`, allowing for GPS accuracy.

3. Policy per location

Block or *allow but flag*. Flagged events show up as exceptions for the manager.

Key routes (target)

- `/scan/[locationSlug]`: employee clock-in (public URL, requires the employee to be signed in)
- `/admin`: dashboard (live headcount, feed, exceptions)
- `/admin/locations`: location CRUD, geofence map, poster printing
- `/admin/people`: invites and roles · `/admin/timesheets`: review, approve, export
- Server actions or route handlers for clock events. **All validation happens on the server.**

Built to be believed

These are design rules, decided now because they shape the database and code. The legal side (consent wording, how long data is kept, which laws apply) is a separate decision, listed in section 09.

Clock-ins can be believed

- The server decides whether a clock-in is valid. The phone only sends evidence (location, QR token).
- Failed checks are recorded as flagged events. They're never silently dropped or silently accepted.
- Timesheet edits never overwrite the original record. Each edit stores who made it, when and why.

Each company's data is walled off

- Every table is scoped by `org_id`, with row-level security in the database itself, not only in the app's code. A bug in the app still can't show one company's records to another.
- The app connects to the database with a restricted account that can't bypass those rules.
- Automated tests prove that company A can never read company B's data, and that an employee can see only their own records.

Employees' location is respected

- Location is read only at the moment of clocking in or out. There's no background tracking.
- *Leaning towards:* storing only the distance from the location and the GPS accuracy, not the exact coordinates. If so, `lat` and `lng` would be dropped from `clock_events`. To be decided along with the privacy decision.
- The clock-in screen says in plain words what is checked and why.

Reliability

- Every request carries a reference code that's shown on any error, so a problem can be found in the logs quickly.
- Errors go to an error tracker (e.g. Sentry). A health-check endpoint reports the database and email status.
- Tests cover the rules (unit tests), database security (RLS tests) and full journeys in a browser (Playwright).

Operating cost

At pilot scale, Tock runs on the free or entry tiers of Vercel and Supabase. Costs grow mainly with the number of clock events, live dashboard connections (Supabase Realtime) and emails. All three grow with paying customers.

One known limit: Supabase's built-in email service is heavily rate-limited, so sign-in links need a proper email provider (e.g. Resend) before real teams use Tock.

Known technical debt in the prototype

- Sample data in `app/admin/page.tsx`; the form in `components/SignForm.tsx` doesn't save anything.
- The scan page triggers a Next.js `cacheComponents` warning (`params` read outside `<Suspense>`).
- The generic "Create Next App" title, indigo theme, and visitor-style form (name + contact) need to become Tock's employee flow.

09 · KEY IMPLEMENTATION STEPS

What's built and what's next

Phases are ordered by UI first, then the minimum backend to make it real.

Phase	Goal	Deliverables	Status
Prototype	Click through the idea	Sign-in screen, admin dashboard with sample data, QR poster generator	Done (inherited)
0. Rebrand the prototype	Make it look and feel like Tock	Electric color tokens and fonts in Tailwind; new clock-in screen (big clock, round button, greeting); restyled admin dashboard and QR poster; fix the Suspense warning; update the README	Next
1. Make it real	Saved clock-ins + login	Supabase project; schema + RLS + isolation tests; admin login; employee magic-link sign-in; clock events saved; dashboard reads real data	Later
2. Locations	Admin-managed sites	Location CRUD, slugs, printable posters, invite employees	Later
3. Trust	Stop buddy punching	Geofence check, signed QR tokens, flagged events, exception view	Later
4. Payroll-ready	Hours you can pay from	Timesheets, edits with audit trail, approvals, CSV export, auto clock-out reminders	Later
5. Proximity prompts	"You've arrived, clock in?"	PWA push or native wrapper with background geofencing	Later
6. Business	Get paid	Self-serve signup, Stripe billing, free tier limits, marketing site	Later

Deferred decision: privacy and compliance. Tock collects names, contact details and location data. Before any real customer data (end of Phase 1 at the latest) we need to decide what location data is stored and for how long, how employees consent, and which regulations apply (e.g., GDPR, US state privacy laws, labor record-keeping rules). The design principles in section 08 already apply.

Deliberately not in the first version

Each can be reconsidered once pilots show demand.

- Native phone apps (until Phase 5 needs one)
- Shift scheduling and rotas
- Fingerprint or face scanning
- Running payroll itself (Tock exports hours; payroll tools pay people)
- Paid time off and leave tracking
- AI features
- Hardware kiosks

Before a paid launch

- A separate production Supabase project (not shared with development)
- A proper email provider for sign-in links and reminders
- Trademark and domain check for "Tock", then a custom domain
- Privacy policy and terms of service reviewed by a lawyer
- Stripe billing and plans, priced from pilot feedback
- Help pages for owners and employees
- Error tracking and a health check in production

09 · RISKS

Risks and how we handle them

Risk	What could happen	How we handle it
GPS is inaccurate indoors	Honest employees get blocked at the door	Allow for the phone's reported accuracy; default new locations to "allow but flag" rather than "block"; managers approve flagged events in one tap
Staff without a smartphone or data	Some employees can't clock in	A shared-tablet mode with a personal PIN, and audited manual punches by a manager
Employees push back on location checks	Low adoption, morale issues	Location only at the clock moment, explained on screen; employees can see what was stored about them
Wage and hour law	Disputes over hours, or businesses relying on Tock for legal compliance	Tock records hours, and the employer stays responsible for paying them correctly. Edits are audited. Terms say this clearly. Legal review before a paid launch
Forgotten clock-outs	Inflated or broken timesheets	Reminders, automatic flags and, later, proximity prompts
Browsers can't run background geofences	Proximity prompts aren't possible on the web	Planned as Phase 5 with an installable web app or a thin native wrapper
Competitors with free tiers	Hard to win on price	Compete on speed, focus and design, and offer our own free tier for small teams
Dependence on Vercel or Supabase	Price or service changes	Standard technology (PostgreSQL, Next.js) that can move to other hosts

Open questions

- Trademark and domain check for "Tock"
- Privacy and compliance approach for location data
- Beachhead industry for the first pilots
- Static vs. rotating QR codes as the default (security vs. cost and simplicity)
- Which payroll integration to build first (Gusto, QuickBooks, ADP?)

Instructions for Claude

Paste this into a Claude Code session (or keep it as `CLAUDE.md`) when working on Tock.

```
You are working on Tock, a QR-based employee time clock (repo: qr-signin-admin).
Read the founding document first (docs/founding/founding-document.html). It is the source
of truth for vision, brand, and architecture.

Context
- Stack: Next.js 16 App Router, React 19, Tailwind 4, TypeScript. Deploy: Vercel.
  Backend: Supabase (Postgres + Auth + Realtime + RLS).
- Current focus: UI/UX and brand personality (section 07). Base features must work end-to-end.
- Work phase by phase (section 09). Don't start a later phase's features unless asked.

Brand rules (enforce in every UI change)
- Colors: ink #141414, volt #C6F432, bone #F5F5F0, pop #FF5C8A, graphite #2A2A2A, smoke #8A8A85.
  Define them as Tailwind theme tokens. Never hard-code hex in components.
- One volt element per screen (the primary action). Text on volt is ink. Never volt on bone.
- Dark-first employee screens. Big numerals. Round 96px+ clock button. Transitions under 200ms.
- Copy is short, warm, a little cheeky, in sentence case. Use "Clock in", not "Submit".
  Use the voice table in section 07.

Engineering rules
- Validate every clock event on the server (identity, geofence, QR token). Never trust the client.
- Every table is scoped by org_id with RLS policies. Write migrations as SQL files in
  supabase/migrations.
- Keep components small and in /components. Use server components by default and add
  "use client" only where needed. Wrap dynamic params/searchParams in <Suspense>
  (cacheComponents is on).
- Work on a feature branch per change. Run `npm run lint` and `npm run build` before saying
  a change is done.
- Never put passwords, API keys or demo logins in docs or committed files. Keep them in
  .env.local (git-ignored) and use clearly fake seed data for demos (e.g. the Daybreak
  Coffee demo account).
- After any UI change, run the dev server, check the page in the browser at mobile (375px)
  and desktop widths, and show a screenshot.

Demo videos
- When asked for a demo, script the flow (e.g., admin creates location → prints poster →
  employee scans → clocks in → dashboard headcount updates), automate it with Playwright
  against the local dev server at a mobile viewport, and record the video. Save it to
  /docs/demos/ with a short caption file.

When unsure about product decisions, check the founding document. If it doesn't answer the
question, ask instead of guessing.
```

APPENDIX

Pages and glossary

Pages in the product

Who	Today (prototype)	Target
Public	`/` landing page with links to the admin pages	Marketing site, sign-up, log in
Employee	`/scan/[locationId]` sign-in form (name, contact, in/out)	`/scan/[locationSlug]` clock-in screen; "My hours"
Admin	`/admin` dashboard (sample data), `/admin/qr` poster generator	Dashboard, Locations, People, Timesheets, Exceptions, Settings and billing
Downloads	CSV of sample log, printable QR poster	Timesheet CSV and payroll exports, printable posters

Glossary

Term	Meaning
Clock event	One clock-in or clock-out, with time, location check results and whether it was flagged
Shift	A clock-in and its matching clock-out (or a planned block of work, once scheduling exists)
Exception	Anything a manager should look at: a flagged clock-in, a missed clock-out, a late arrival
Flagged	Accepted but marked for review because a check didn't fully pass
Geofence	The circle around a location (center point + radius) where clocking in is allowed
QR token	A short-lived signed code in the QR link that proves the scan happened recently
Buddy punching	One employee clocking in or out for another
Headcount	The people whose most recent clock event is a clock-in
Pay period	The date range a timesheet covers (e.g. weekly or every two weeks)
Timesheet	An employee's shifts and total hours for a pay period, ready for approval
Proximity prompt	A phone notification offering to clock in when the employee arrives at a location
Org	One customer company in Tock, with its own locations, people and data
