00 · SUMMARY

At a glance

Musterpass is a site check-in platform. Everyone who arrives at a work site scans a QR code, takes a selfie, completes the day's safety form with photo evidence, and signs off. That one scan clocks them in. Managers see who is on site, whether they are cleared to work, and have a timestamped, photo-backed record ready for any audit or incident.

What changed in version 0.3

- **From time clock to site safety.** Clocking in is now a by-product of checking in safely, not the product itself.
- **Photo verification** in three separate roles: identity, presence and compliance.
- **The first form is the Field Level Hazard Assessment (FLHA),** the daily pre-task hazard check used across Canadian construction.
- **A full SaaS journey** from company sign-up to daily use, with per-company pricing and a Billing page.
- **Construction first, food service second.** Everyone on site checks in: employees, subcontractors and visitors.
- **Supabase and Vercel** are now planned in detail, including how photos and personal data are protected.
- **A new name: Musterpass.** It replaces the working name "Tock" (see section 07).

For companies

Sign up, choose "Construction", and get a ready-made FLHA, dashboard and site posters. One flat price per company, with no per-worker counting.

For workers and visitors

Scan with the phone camera. No app, no paper. About a minute to check in and sign the day's FLHA.

For safety managers

Live list of who is on site and cleared. Hazards flagged the moment they are reported. Records exported in one click.

Where we start

Construction in British Columbia, then Alberta and the rest of Canada. **Food service** (commercial kitchens) is the second industry, using the same engine with its own forms.

Why Musterpass exists

Mission

Make it faster to do safety right than to skip it, and give every company proof that it did.

Vision

No more clipboards at the site trailer. Every worker, subcontractor and visitor checks in on their own phone, confirms the day's hazards and controls, and leaves a record that is complete, signed and photo-backed before they pick up a tool.

The problem

- **Paper safety forms arrive late.** FLHAs and sign-in sheets are filled in on clipboards, then collected, scanned or typed up days later, if they are not lost.
- **Paper proves little.** After an incident it is hard to show who was on site, when, and whether they were briefed. Signatures can be added after the fact.
- **Liability falls on the company.** Missing or late records weaken its position with the regulator, insurers and in court.
- **Nobody knows exactly who is on site.** That matters for emergency roll calls (muster) and for paying people correctly.

Values (each one is a product rule)

Proven, not claimed

Every check-in and form carries server time, location and photos that cannot be edited afterwards.

Evidence at the moment, never surveillance

Photos and location are captured only at check-in, check-out and in forms. No tracking during the shift.

Faster than paper

A daily check-in with FLHA must take about a minute. If paper is faster, we've failed.

Fair to everyone on site

Workers can see their own records. Nothing is changed silently; every correction is logged with who and why.

The product

Surface	Who	What it does
Site QR poster	Printed by the company, scanned by everyone	One per site entrance. Opens the check-in flow for that site
Check-in flow (mobile web)	Workers, subcontractors, visitors	Identify → selfie → site check → FLHA with compliance photos → sign → checked in (and clocked in)
Check-out	Everyone on site	Scan again at the end of the day; optional "any incidents?" question
Safety dashboard	Safety managers, supervisors	Who is on site now, FLHAs submitted, hazards flagged, selfies to review, muster list
Forms	Company admins	Industry templates (FLHA first), edited per company; later, upload an existing paper form to convert it
Sites and people	Company admins	Create sites and geofences, print posters, invite crews, manage subcontractor companies
Records and exports	Safety managers	Search any day, person or site; export a PDF or CSV for audits, COR, insurers or incident investigations
Billing	Company owner	One subscription per company: plan, invoices, payment method. Linked next to Admin in the top navigation

Core capabilities

1. **One-scan check-in** for everyone, including people the company never invited.
2. **Photo verification** in three roles (next page).
3. **Digital FLHA** signed before work starts, with hazards and controls, PPE photos and supervisor review.
4. **Live site roster and muster list** for emergencies.
5. **Automatic time records** from check-in and check-out, exportable for payroll.
6. **Industry-aware setup:** choosing an industry sets up forms, dashboard cards and wording automatically.
7. **Evidence-grade records**: server timestamps, location, hashed photos and an append-only audit trail.

01 · PHOTO VERIFICATION

Three kinds of photo, three jobs

Photos are what make our records stronger than paper. They do three different jobs, and we keep them separate in the product, in storage and in how long we keep them.

1 · IDENTITY

Is this the right person?

- A selfie taken live in the check-in flow (camera only, no gallery uploads).
- Shown next to the person's profile photo for a **supervisor to review**. Mismatches are flagged.
- Stops buddy punching and borrowed accounts.
- **No automatic face matching** for now. That would be biometric processing with stricter legal rules; it is future scope.

2 · PRESENCE

Are they really on site?

- The phone's location at the moment of check-in, compared with the site geofence on the server.
- The QR code carries a short-lived token, so a photo of the poster doesn't work from home.
- The selfie background adds visual proof of the site.
- Optional per site: a photo of the entrance or posted site board.

3 · COMPLIANCE

Is the work set up safely?

- Photos attached to answers inside the FLHA: PPE worn, harness tie-off, barricades, housekeeping.
- The form decides which answers require a photo.
- This is the strongest evidence in an audit or after an incident.
- Kept as long as the safety record itself.

Rules for every photo

- **Captured live** in the app with the camera, never picked from the photo gallery.
- **Stamped by the server** with time, site, person and location, and stored with a SHA-256 hash so any later change is detectable.
- **Private by default.** Viewable only by authorized people in that company, through links that expire in minutes.
- **Separate retention.** Identity selfies are kept for a short period (proposal: 90 days, unless attached to an incident); compliance photos are kept with the safety record. Final periods to be set with legal advice.
- **Explained up front.** The first check-in shows plain-language consent wording, and we store which version each person accepted.

01 · THE FIRST FORM TEMPLATE

Field Level Hazard Assessment

The FLHA is a short pre-task check where each worker identifies the hazards of today's work and how they're controlled. It is widely used on Canadian construction sites as part of the hazard assessment that occupational safety rules require, and it must be redone when the task or conditions change.[6] [7] WorkSafeBC does not mandate one specific FLHA form, so ours is a strong default that each company can adapt.

1 · Job details

Site (from the QR), date and time (automatic), worker and employer company, supervisor, task description, work location on site.

2 · Fit for work

"Are you fit for duty today?" Have you reviewed the site orientation and know the muster point? Any "no" alerts the supervisor.

3 · Hazards (tick all that apply)

Working at heights · falling objects · mobile equipment · excavation or trenching · electrical · hot work · confined space · hazardous materials · noise · weather · slips, trips and housekeeping · manual lifting · other (describe).

4 · Controls

For each hazard ticked: how it's controlled (guardrail, tie-off, spotter, barricade, lockout, ventilation, permit...). Height, excavation and hot-work answers **require a compliance photo**.

5 · PPE check

Hard hat · hi-vis · safety boots · eye protection · gloves · hearing protection · fall protection. One PPE photo (compliance photo).

6 · Sign-off

Worker signs on screen. Supervisor reviews and countersigns from the dashboard. If conditions change, "Update my FLHA" creates a new version, never an overwrite.

Food service (second industry) uses the same engine with different templates: opening checklist, fridge and cooler temperature log, food-handler hygiene check, and closing checklist.

01 · HOW IT WORKS

From sign-up to every day

The company’s journey (SaaS onboarding)

1 · Sign up

Company name, owner account, and "What industry are you in?"

2 · Auto-setup

Construction loads the FLHA, dashboard cards and wording.

3 · Add sites

Address and geofence; print each site's QR poster.

4 · Invite

Supervisors and crews by email or SMS. Subcontractor companies by link.

5 · Customize

Adjust the FLHA, choose which answers need photos.

6 · Go live

Free trial ends; choose a plan on the Billing page.

7 · Daily use

Everyone checks in; supervisors review and countersign.

8 · Prove it

Export records for audits, COR, insurers or incidents.

The worker’s check-in (every day)

Scan

Phone camera on the site poster.

Who are you?

Signed-in workers are recognized. New people enter name, company and phone once.

Selfie + site check

Identity photo and location, checked by the server.

FLHA and sign

Hazards, controls, PPE photo, signature. "You're checked in."

Everyone else

Subcontractors

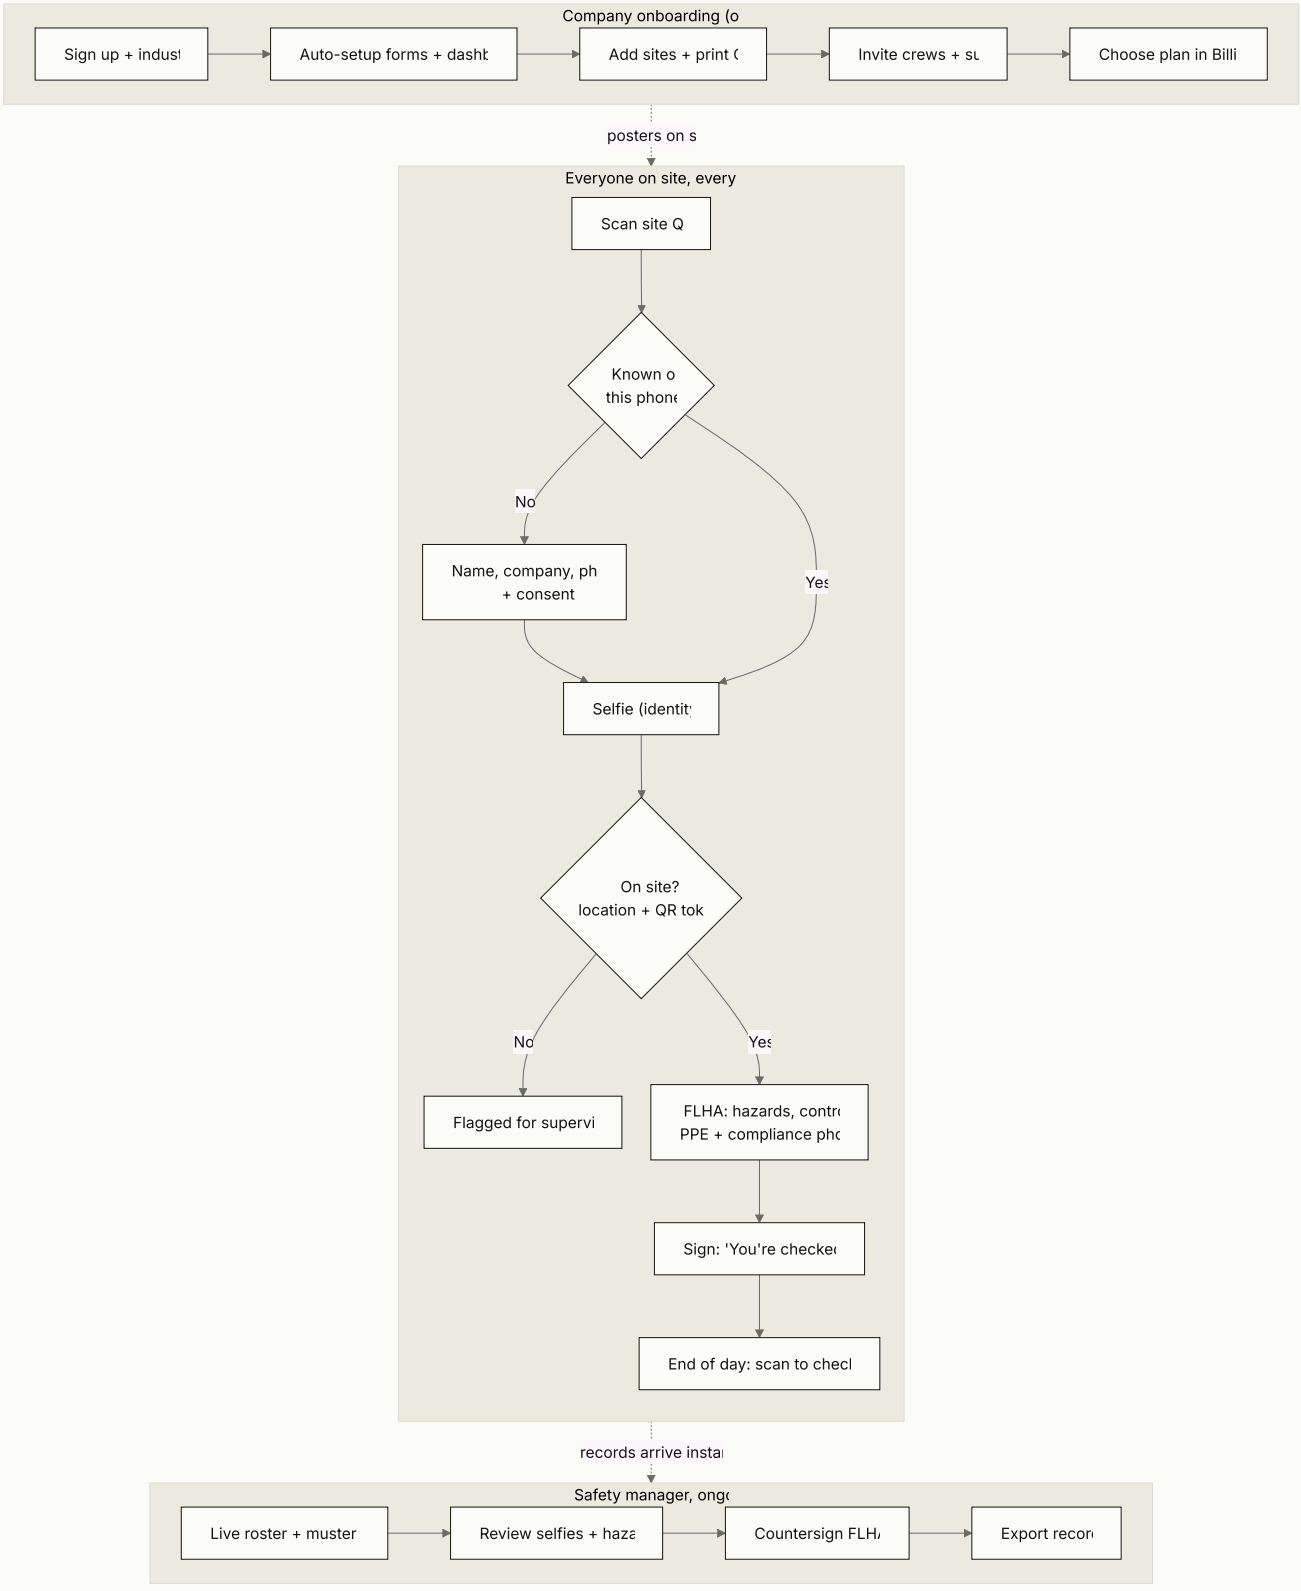

Scan the same poster. If their company is linked, their records are shared with it; if not, the general contractor still gets the full check-in and FLHA.

Visitors and inspectors

A shorter visitor form (who you're seeing, site rules acknowledged, selfie). They appear on the muster list until they check out.

01 · HOW IT WORKS

User journey and workflow

01 · A WORKED EXAMPLE

Northshore Builders

Northshore Builders is a made-up company. It will be the demo account and the script for the demo video.

Northshore Builders is a general contractor in Burnaby with 60 workers across three sites and about a dozen subcontractor crews. Until now, FLHAs were done on clipboards and collected by the site supervisor at the end of the week.

Setup · Monday, 15 minutes

Priya, the safety manager, signs up and picks "Construction". The FLHA, dashboard and wording load automatically. She adds the Lonsdale Tower site, prints two posters for the gates and invites the supervisors.

Check-in · Tuesday, 6:48 am

Jas, a framer, scans the gate poster, takes a selfie and fills in the FLHA: working at heights, controlled by guardrails and tie-off. The form asks for a photo of the harness. Jas signs, and the dashboard shows 23 on site.

A walk-on · 7:05 am

An electrician from a subcontractor the company never invited scans the same poster, enters name, company and phone, does the selfie and FLHA, and appears on the roster like everyone else.

A hazard · 9:30 am

A labourer ticks "Excavation" with no barricade photo. The supervisor gets an alert, the area is barricaded, and the FLHA is updated as a new version with the photo.

Three weeks later, a worker is injured on site. Priya exports that day's records in one click: who was on site, each signed FLHA with timestamps, location and photos, and the supervisor's countersignature. With paper, this would have taken days and might not have existed.

02 · MARKET OPPORTUNITY

Safety is a must-have, not a nice-to-have

~$2–3B

Global construction safety and risk software market, 2025 estimates.[1] [2]

~11–12%

Estimated annual growth for construction safety software through the early 2030s.

$3.7–4.0B

The adjacent time and attendance market we also replace.[3]

Research firms define these markets differently, so we treat the figures as a rough guide.

Why now

- Regulators, insurers and owners increasingly expect documented hazard assessments, and paper is the weak link.
- Every worker has a smartphone, but most site paperwork is still on clipboards.
- Certification programs such as COR reward companies with good records, which gives buyers a concrete reason to switch.
- Existing safety platforms are built for large contractors, with per-user pricing and long rollouts. Small and mid-size contractors are underserved.

Beyond construction

Food service (second): kitchens run daily checklists and temperature logs on paper for health inspections. **Warehouses** and **public-sector field teams** (for example police or municipal crews using site questionnaires) are later options; public-sector buyers will require Canadian data residency, which our Supabase plan already allows.

Proof, the moment they arrive

Replace the clipboard at the gate with one QR code. Everyone on site checks in from their own phone, takes a selfie, signs today's FLHA with photo evidence, and is clocked in. You see who's on site and cleared to work, and you have **proof that stands up** when it matters.

Stakeholder	Pain today	What Musterpass gives them	Proof point
Owner / buyer	Liability and insurance exposure from missing records	Complete, signed, photo-backed records for every day on every site	Records available within minutes of an incident
Safety manager	Chasing clipboards; typing up forms; COR audit prep	Forms arrive instantly; one-click exports; flagged hazards	Hours per week saved; audit prep time
Site supervisor	Not knowing who's on site; collecting signatures	Live roster, muster list, alerts, countersign on phone	Time to account for everyone in a drill
Worker / subcontractor	Clipboard queues; paperwork before work	About a minute on their own phone; their records visible to them	Check-in time
Payroll	Hand-written hours	Check-in and check-out times as a timesheet export	Timesheet corrections per week

Pricing: one price per company (hypothesis to validate)

Competitors mostly charge per user (SafetyCulture lists $24 per user per month) or quote by company size (SiteDocs).[4] [5] On construction sites, the number of people changes daily and many are subcontractors, so **per-user pricing punishes exactly the behaviour we want**: everyone checking in. We charge one price per company, with tiers by number of active sites.

Crew · ~$149/month

1 active site. Unlimited workers, subcontractors and visitors. FLHA and visitor forms. 30-day free trial.

Company · ~$399/month

Up to 10 active sites. Form customization, exports, supervisor countersign, time records.

Enterprise · custom

Unlimited sites, SSO, longer retention, API access, dedicated onboarding.

Prices are placeholders to test in pilots. Annual billing at a discount; prices in CAD for Canadian customers.

Where Musterpass fits

> **Honest view:** digital safety forms are not new. SiteDocs, SafetyCulture, HammerTech and others offer them. We win on speed at the gate, photo evidence by default, and pricing that welcomes subcontractors, not on having more features.

Competitor	What it does well	Where we're different
SiteDocs	Construction safety compliance: digital hazard assessments and FLRAs, toolbox talks, custom forms, certifications, offline access. Popular with small construction teams; priced annually by company size.[4]	Our check-in, selfie, FLHA and clock-in happen in one scan with no app install; photo evidence is built into every record
SafetyCulture	Flexible inspections and checklists across industries; free for up to 10 users, Premium $24 per user per month.[5]	Built for construction sites and walk-on subcontractors; flat company price
HammerTech	Construction safety and site management for larger contractors; custom pricing.[5]	Simpler and faster to set up for small and mid-size contractors
Salus, Raken, Procore forms	Safety and daily reporting inside wider platforms	Focused on the gate moment rather than project management
Time clocks (Jibble, Connecteam, Buddy Punch)	GPS and photo clock-in for hourly teams	We add the safety form and evidence, which is what construction buyers pay for
Paper and clipboards	Free and familiar	Late, lossy and weak as evidence

Musterpass's edge

Advantage	Why it matters	Defensibility
One scan does everything	Check-in, identity, FLHA, sign-off and clock-in in about a minute	Medium; it's in the product design
Evidence-grade photos	Server-stamped, hashed, private; three clear roles	Medium–high; hard to bolt on later
Flat per-company pricing	No reason to keep subcontractors off the system	High against per-user competitors
No app install	Walk-on subs and visitors can check in on the spot	Medium
Industry auto-setup	Useful on day one for construction, then food	Medium
Canadian data residency	Matters to Canadian contractors and public-sector buyers	Medium

Who Musterpass is for

Primary ICP	**Construction, starting in BC**
Company	General contractors and trade contractors with 10–250 workers and 1–10 active sites
Current setup	Paper FLHAs and sign-in sheets, or a safety app that crews avoid
Buyer	Safety manager or owner; operations manager in smaller firms
Daily users	Workers, foremen, subcontractor crews, visitors and inspectors
Trigger events	A COR audit, an incident or near miss, an insurer request, a new large site, a failed muster drill

Secondary ICP	**Food service**
Company	Restaurant groups, commercial kitchens, caterers with 2–20 locations
Forms	Opening and closing checklists, temperature logs, hygiene checks
Buyer	Operations manager or owner

Not a fit (for now)

- Large enterprises needing full project management or ERP integration on day one
- Fully remote or office teams
- Use cases that need automatic face recognition (future scope only)

Start on BC sites, spread through subs

1. **Founder-led pilots (months 0–3):** 5–10 BC contractors, one site each, free in exchange for feedback and a case study.
2. **Safety consultants and COR advisors:** they set up safety programs for many contractors and can recommend us.
3. **Industry associations and events:** construction safety associations, trade shows, toolbox-talk content.
4. **Self-serve trial:** sign up, print a poster and run a first FLHA within 15 minutes.
5. **Our own demo video:** scripted from the Northshore Builders example and recorded from the real app. We study how competitors present themselves, but never copy their videos or materials.
6. **Food service (later):** once the forms engine is proven, launch restaurant templates with one restaurant group as a design partner.

Built-in growth

Subcontractors spread it

A sub crew checks in on several general contractors' sites. Each one learns the product and can bring it to its own company.

The poster is the ad

Every gate poster carries the brand and a "get this for your company" link.

Records sell the product

Every clean export shown to an auditor or insurer demonstrates the value to people who influence buying decisions.

Early metrics: time from sign-up to first FLHA, check-ins per site per day, share of check-ins with all required photos, subcontractor share of check-ins, trial-to-paid conversion.

Bold, quick, trusted on site

Personality

Still bold and quick, but now also **trustworthy**: this product holds evidence. Plain words, big tap targets for gloved hands, and no jokes on safety screens. The cheeky voice stays for greetings and confirmations.

Color: ”Electric”, now with a reason

Volt lime is the colour of hi-vis vests, so the palette fits construction naturally. Pop pink marks hazards and flags.

ink	volt	bone	pop	graphite	smoke
#141414	#C6F432	#F5F5F0	#FF5C8A	#2A2A2A	#8A8A85

Rules from version 0.2 still apply: one volt element per screen, ink text on volt, never volt on bone. `pop-deep` (#B8154F) is used for pink text on light backgrounds.

Voice on site

Instead of	We say
"Submit form"	"Sign and check in"
"Upload image"	"Take a photo of your harness"
"Validation error: field required"	"Add a photo of the barricade to continue."
"Submission successful"	"You're checked in at Lonsdale Tower. Work safe."
"Active users: 23"	"23 on site · 2 waiting for review"

Usability on site

- Works with gloves: tap targets at least 56px, no small checkboxes.
- Readable in sunlight: high contrast, large type.
- Works on weak signal: the form saves as you go and sends when it can.

07 · NAMING

Our name: Musterpass

"Tock" was a clock name, and it clashes with the Tock restaurant-reservation platform. The new name should say presence, safety or the site. The shortlist below was checked on 13 November 2026: the exact **.com and .ca are both unregistered**. Short words like site-, crew-, safe- and gate- names are all taken.

Name	Idea	Works for food too?
Musterpass	"Muster" is the roll call at the emergency assembly point; a pass means you're cleared. Safety and presence in one word	Yes (fire musters everywhere)
Mustercheck	Same root, more literal: the check at the muster	Yes
Hazardpass	You've assessed the hazards and you're cleared to work	Yes
Hardhatin	"Hard hat in": checking in, construction-style. Friendly and memorable	Weak (construction-specific)
Hivispass	Hi-vis plus pass; ties directly to the volt colour	Weak
Tailgatecheck	A "tailgate meeting" is the daily safety talk at the truck	Weak
Toolboxsign	"Toolbox talks" are the short daily safety briefings crews sign	Weak

Decision: Musterpass. It works for construction and food, it names the safety moment and the clearance, and both domains were free. Next steps: register musterpass.com and musterpass.ca, and run a trademark search (CIPO and USPTO) before using it publicly.

Earlier, clock-focused shortlists (Qtock, Qtap, Klok, Presente) are retired because the product is no longer only a clock.

08 · TECHNICAL ARCHITECTURE

A small, modern stack

Layer	Choice	Notes
Frontend	**Next.js 16** + React 19 + Tailwind 4	Already built (Phase 0)
Hosting	**Vercel**	Preview deployment for every pull request; production from `main`
Database	**Supabase Postgres**, Canada (Central) region	Row-level security on every table
Auth	**Supabase Auth**	Admins: email + password with MFA. Workers: SMS or email one-time code. Walk-ons: anonymous session tied to the check-in
Files	**Supabase Storage**, private buckets	Selfies and compliance photos; short-lived signed links only
Realtime	**Supabase Realtime**	Live roster and alerts on the dashboard
Billing	**Stripe**	One subscription per company; Billing page links to Stripe's customer portal
Email / SMS	Resend (email), Twilio or similar (SMS)	Sign-in codes, invites, hazard alerts

Data model (initial)

```
companies        (id, name, industry, plan, billing_customer_id, created_at)
sites            (id, company_id, name, address, lat, lng, radius_m, qr_secret, active)
people           (id, company_id, user_id?, name, phone?, employer_company, role:
                  owner|safety_manager|supervisor|worker|subcontractor|visitor, profile_photo_id?)
check_ins        (id, company_id, site_id, person_id, checked_in_at, checked_out_at,
                  distance_m, accuracy_m, qr_token_ok, selfie_photo_id, status, review_status)
form_templates   (id, company_id?, industry, key: 'flha', version, schema_json)
form_submissions (id, company_id, check_in_id, template_id, version, answers_json,
                  signed_at, supervisor_id?, countersigned_at?, supersedes_id?)
photos           (id, company_id, kind: identity|presence|compliance, storage_path,
                  sha256, captured_at_server, lat, lng, submission_id?, retain_until)
consents         (id, person_id, wording_version, accepted_at)
audit_log        (id, company_id, actor_id, action, target, at, details_json)  -- append-only
```

Key routes (target)

`/s/[siteSlug]` check-in · `/admin` dashboard · `/admin/sites` · `/admin/people` · `/admin/forms` · `/admin/records` · `/admin/billing` · `/signup`. All validation happens on the server.

08 · SUPABASE PRIVACY PLAN

Built to protect people and evidence

Photos of people plus their location are sensitive personal information under Canadian privacy law (PIPEDA, and BC and Alberta PIPA). These are the technical rules; the legal side (policy wording, retention periods) needs a lawyer before the first pilot.

Where data lives

- Supabase project in the **Canada (Central)** region.
- Separate projects for development, staging and production. Real data only in production.
- Point-in-time backups on the production project.

Who can see what

- **Row-level security** on every table, scoped by `company_id` and role.
- Workers see only their own records; supervisors see their sites; safety managers see the company.
- Automated tests prove company A can never read company B, and that public visitors can't read anything.

Photos

- **Private storage buckets** only; no public URLs ever.
- Uploads use one-time signed upload URLs issued by the server after the check-in is validated.
- The server records time, location and SHA-256 hash; photo rows can't be updated or deleted by users.
- Viewing uses signed links that expire in a few minutes.
- Hidden metadata (EXIF) is stripped from stored copies; the evidence fields live in the database.

Keys and access

- The **service-role key** lives only in server environment variables on Vercel, never in the browser or the repo.
- The browser uses the public anon key, which can do nothing without RLS permission.
- Admin accounts require MFA. Staff access to production is limited and logged.

Retention and deletion

- Each photo stores `retain_until`. A scheduled job (pg_cron) deletes expired identity selfies.
- Safety records and compliance photos follow the company's retention setting, with a legal minimum we confirm with counsel.
- Incident "legal hold" stops deletion for the affected records.

Consent and transparency

- First check-in shows what is captured, why, and for how long. The accepted wording version is stored.
- People can see their own records and request access or correction.
- An append-only audit log records every view of photos and every change to records.

> **Future face matching** (comparing selfies automatically) would be biometric processing. It needs explicit consent, a separate legal review, and is excluded until then.

Ready to ship

Setup

1. **Import the GitHub repository** (`ANwagha/qr-signin-admin`) into Vercel. The framework is detected as Next.js; no extra build settings needed.
2. **Production branch:** `main`. Every other branch and pull request gets its own preview URL to review before merging.
3. **Environment variables**, set separately for Preview and Production:
   - `NEXT_PUBLIC_SUPABASE_URL`, `NEXT_PUBLIC_SUPABASE_ANON_KEY` (safe for the browser)
   - `SUPABASE_SERVICE_ROLE_KEY`, `STRIPE_SECRET_KEY`, `STRIPE_WEBHOOK_SECRET`, `QR_TOKEN_SECRET` (server only)
4. **Preview deployments use the staging Supabase project,** never production data.
5. **Function region:** choose the Vercel region closest to Supabase's Canada (Central) region. If a contract requires that data never leaves Canada, confirm whether that's possible on our Vercel plan before signing.
6. **Custom domain** (musterpass.com, once registered) (`app.musterpass.com`); HTTPS is automatic.

Why it matters now

- **The camera needs HTTPS.** Live camera capture in the browser only works on secure (https) pages, so real phone testing of selfies and photos should happen on a Vercel preview URL, not on the local network address.
- Preview links make it easy to show your boss and pilot customers each step.

Before the first production deploy

☐ `npm run lint` and `npm run build` pass (they do today)

☐ No secrets in the repository; `.env.local` is git-ignored

☐ Remove the developer-only `allowedDevOrigins` IP (it has no effect in production, but should not drift)

☐ Error tracking (e.g. Sentry) and a health-check route

☐ Privacy policy and terms pages live

09 · KEY IMPLEMENTATION STEPS

What’s built and what’s next

We work one step at a time, each as its own prompt and branch.

Step	Deliverables	Status
Prototype + Phase 0 rebrand	Brand, clock-in screen, dashboard, QR posters (time-clock version)	Done
Founding document v0.3	This document: the site-safety pivot	Done
1. Check-in prototype	Clickable flow: scan → identify → selfie → site check → FLHA with compliance photos → sign. Dashboard with roster, FLHAs, hazards and selfie review. Billing page linked next to Admin. Visitor form. Demo data: Northshore Builders	Next
2. Supabase foundation	Projects (dev, staging, prod) in Canada; schema, RLS and isolation tests; auth (admins, workers, walk-ons); private photo storage with hashing; audit log	Later
3. Vercel deployment	Connect repo, environment variables, preview + production, HTTPS camera testing on phones	Later
4. SaaS onboarding	Sign-up, industry auto-setup, sites, invites, subcontractor companies	Later
5. Trust	Geofence and QR tokens enforced server-side; supervisor countersign; exports (PDF, CSV)	Later
6. Billing	Stripe subscriptions per company, trial, plans, customer portal	Later
7. Food service	Templates and dashboard for kitchens	Later
Future	Upload a paper form to convert it (AI); face matching (after legal review); proximity prompts; offline-first native wrapper	Future

Deliberately not in the first version

- Automatic face matching
- AI conversion of uploaded forms
- Native phone apps
- Scheduling and payroll processing
- Project management features

Before the first paid customer

- Privacy policy, terms and consent wording reviewed by a lawyer
- Retention periods confirmed
- Production Supabase in Canada with backups
- musterpass.com and .ca registered, trademark search done
- Stripe billing live

09 · RISKS

Risks and how we handle them

Risk	What could happen	How we handle it
Privacy and photos	A breach or misuse of selfies and locations	Canadian region, RLS, private buckets, expiring links, short selfie retention, audit log, legal review before pilots
Workers resist selfies	Low adoption, union concerns	Clear purpose and retention on screen; supervisor review only, no face matching; workers see their own records
Weak signal on site	Forms fail to send	Save progress locally and send when connected; the server still timestamps on arrival and keeps the phone's capture time
Gloves, sun, noise	The app is hard to use outdoors	Large targets, high contrast, minimal typing, photo prompts instead of text
FLHA becomes tick-box theatre	Records exist but nobody thinks	Required photos for high-risk answers; supervisor countersign; hazard alerts
Relying on us for compliance	A company assumes the app makes it compliant	The app records and supports; the employer stays responsible. Clear terms and onboarding
GPS inaccuracy	Honest workers flagged	Allow for reported accuracy; flag rather than block by default; supervisor approves in one tap
Established competitors	SiteDocs and others already sell to our buyers	Win on speed at the gate, evidence, and flat pricing; target firms still on paper

Open questions

- Register musterpass.com and .ca, and run the trademark search
- Retention periods for selfies and safety records (legal advice)
- Pricing levels, tested with pilot customers
- Which payroll export formats pilots need
- Which BC contractors to approach for the first pilots

Instructions for Claude

Paste this into a Claude Code session (or keep it as `CLAUDE.md`) when working on the product.

```
You are working on Musterpass (formerly the working name Tock), a site check-in
and safety compliance SaaS (repo: qr-signin-admin). Read docs/founding/founding-document.html
first. It is the source of truth for vision, brand, privacy and architecture.

Context
- Product: one QR scan at a site entrance → identify → selfie → site check → FLHA with
  compliance photos → sign → checked in (and clocked in). Construction first, food second.
  Everyone on site checks in: employees, subcontractors and visitors.
- Stack: Next.js 16 App Router, React 19, Tailwind 4, TypeScript. Vercel. Supabase (Canada
  Central): Postgres + Auth + Storage + Realtime, with RLS on every table. Stripe for billing.
- Work one step at a time (section 09), each on its own branch. Don't start later steps unless asked.

Photo rules (never break these)
- Three kinds: identity (selfie), presence (location/QR/site photo), compliance (photos in forms).
- Capture live from the camera; never accept gallery uploads for evidence.
- Store in private buckets only. Server records time, location and SHA-256 hash. View via
  short-lived signed URLs. No automatic face matching.

Privacy and security rules
- Never put secrets in the repo or the browser. Service-role key is server-only.
- Every table has company_id and RLS policies; write tests that prove cross-company isolation.
- Records are append-only: corrections create new versions and audit-log entries.

Brand rules
- Colors: ink #141414, volt #C6F432, bone #F5F5F0, pop #FF5C8A, pop-deep #B8154F,
  graphite #2A2A2A, smoke #8A8A85. Use the Tailwind tokens, never raw hex in components.
- One volt element per screen. Ink text on volt. Never volt on bone.
- Big targets (56px+) for gloved hands, high contrast, plain words on safety screens.

Engineering rules
- Validate everything on the server. Wrap request data in <Suspense> (cacheComponents is on).
- Run `npm run lint` and `npm run build` before saying a change is done.
- After UI changes, check the page in the browser at 375px and desktop widths and show a screenshot.
- Use fake demo data (Northshore Builders) and never real people's photos.

Demo videos
- Script the Northshore Builders flow, automate it with Playwright on a phone-sized viewport,
  record it, and save to docs/demos/. Never copy competitors' videos or materials.

When unsure about product decisions, check the founding document. If it doesn't answer, ask.
```

APPENDIX

Pages and glossary

Pages in the product

Who	Today (prototype)	Target
Public	`/` landing page, header links: Admin	Landing page with **Admin and Billing** links in the header; sign-up; log in; privacy and terms
On site	`/scan/[location]` time-clock screen	`/s/[site]` check-in: identify, selfie, site check, FLHA, sign; check-out; visitor form; "My records"
Admin	`/admin` dashboard, `/admin/qr` posters	Dashboard (roster, FLHAs, hazards, selfie review, muster), Sites, People, Forms, Records, Billing

Glossary

Term	Meaning
FLHA	Field Level Hazard Assessment: a short pre-task check of today's hazards and controls, signed by the worker
FLRA	Field Level Risk Assessment: a similar form name used by some companies and competitors
Check-in	One person's arrival at a site: identity, location, form and signature. Also starts their time record
Identity photo	The selfie taken at check-in, reviewed by a supervisor
Presence evidence	Location, QR token and optional site photo showing the person was on site
Compliance photo	A photo inside a form proving a control is in place (PPE, harness, barricade)
Countersign	The supervisor's review and signature on a worker's FLHA
Muster / muster point	The emergency assembly point, and the roll call taken there
Subcontractor	A worker employed by another company working on the site
COR	Certificate of Recognition: a safety certification program that rewards documented safety practices
PPE	Personal protective equipment: hard hat, hi-vis, boots, gloves, eye and hearing protection, fall protection
RLS	Row-level security: database rules that decide which rows each user may read or write
Retention	How long a record or photo is kept before it is deleted automatically
